TORSION BAR TWISTING MACHINE

- This machine is used to perform the torsion test on torsion bars so as to induce torsion property in the bar / to form the twisted inner molecular structure / to measure the twisted residual angle.
- Size of Torsion Bar : L 2310 mm, Dia. 67 mm
- Size of Machine (length x width x height) in mm: - 5400 X 1300 X 1900

FUNCTION

Machine performs twisting operation on torsion bar at one end, by fixing the bar at the other end. The torsion bar will be twisted up to a predefined maximum angle of twist and the maximum load will be noted and then released according to the predefined data until the load becomes 'zero'. At this stage there will be a first residual twisted angle on the bar which will be noted. The second cycle of twisting will be started from the point of the first residual angle and up to the mark of the predefined maximum angle and the corresponding load will be noted and then released back until the load becomes 'zero' and second residual angle to be noted. This will be repeated for five times. There will be a programmable dwell time for each cycle at the maximum angle.
